ABSTRACT OF THE DISCLOSURE

A system and method for exchanging online information along an optimum path in a client/server system which includes a client having a plurality of Internet protocol addresses for sending and receiving the online information over an Internet network, and a server connected to the client Where the client employs a plurality of IP via a router. addresses over a private network and desires to exchange the online information with the server, it sends information about the employed IP addresses to the server and then detects an IP address providing the optimum path for access to the server in response to acknowledgement information from the server. Therefore, the client can send and receive the online information to/from the server along the optimum path, resulting in an increase in information exchange rate and an improvement in the quality of the online information.
